PT Human and rat cadherin polypeptide(s) - mediate cell-cell adhesion PS Claim 1; Column 69-72; 56pp; English.

CC This sequence represents human cadherin-5. The invention specifically CC provides details of human cadherin-5, -8, -11, -12 and -13, and rat CC cadherin-8, -5, -11 and -13. Cadherins are calcium-dependent cell CC definesion proteins. They are glycosylated integral membrane proteins CC that have an N-terminal extracellular domain that determines binding specificity, a hydrophobic membrane spanning region and a C-terminal CC cytoplasmic domain, which is highly conserved among members of the superfamily. The C-terminal domain interacts with the cytoskeleton cC superfamily. The C-terminal domain interacts with the cytoskeleton through eatenins and other cytoskeleton-associated proteins. The present sequence is full length human cadherin-5, which is a Ca2+ dependent cell adhesion protein. The human cadherin cDNA was isolated from a placental cDNA library, using probes based on homologous rat cadherin cDNA.

Antibodies or fragments that specifically bind the human cadherin can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.

Disclosure: Page 16-17: 24pp; Japanese.

The present sequence is used to demonstrate the method of the invention. The specification describes the comparison of DNA base sequences. The method involves 3 steps of: (1) division of a first and second nucleic acid sequence into base groups of three base lengths, and translation into amino acids; (2) all base and amino acid insertions and deletions of the two nucleic acid sequences are observed and the amino acid sequences encoded by these nucleic acid sequences are compared; and (3) adjacent bases and amino acids are compared and step (1) repeated after shifting the translation frame one base towards the 3' end or shifting the translation frame one base towards the 3' end, but the compassing four bases, and not translating the second or third base. The new method is useful for comparing DNA base sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (HITA) HITACHI LTD.

The cadherin proteins may be isolated by using anti-cadherin antibodies. These antibodies may also be used to modulate the activity of cadherin and to determine the tissue specific distribution of cadherin proteins. Each subclass of cadherins has a unique tissue distribution
                                                                                                                                                                                                                                  31-JAN-1995 (first entry)
Beta subunit of integrin cell surface receptor.
Integrin; alpha; beta; subunit; glycoprotein; heterodimer;
transmembrane; extracellular matrix; cell signalling; cytoskeleton;
behaviour; signal transduction; receptor.

PT Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion and regulation activities pc5 - involved in cell-cell adhesion.

CC R87102-R87120 represent partial fragments of the rat protocadherin sequence. The cDNAs encoding these sequences were isolated after cC screening a rat brain cDNA preparation with the primers shown in T03575 cC and T03576. The primers were constructed from portions of the amino acid sequences of the third and fourth extracellular domains of published cC cadherin sequences. The full length cDNA sequence encoding rat cC protocadherin pc5 is represented in T03574. The cytoplasmic domain of cadherin interacts with the cytoskeleton through catenins and other corresponding to the complex construction associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the cadherins which do not possess a cadherins adhesive function. The cadherins which do not possess a

Example 5; Figure 9; 34pp; English.

Integrins are heterodimers comrised of alpha and beta subunits, that are non-covalently associated transmembrane glycoproteins. Il alpha chains and 6 beta chains have been recognised in man. Each alpha committed the subunit tends to associate with only one type of beta subunit but there are several exceptions. Integrins mediate (in part) the interaction of cells with the extracellular matrix, forming a link between the extracellular matrix and the cytoskeleton. They may transmit signals from the extracellular to the intracellular environment, affecting cell behaviour. This sequence is the beta4 subunit of an alpha6 beta4 integrin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8888888
                                                                                                                                                                                          PT Polyniclectide sequences encoding new proto:cadherins - useful PT for modulating natural binding and regulating activities.

Example: Page 38: 114pp: English.

CC Two regions of conserved AA sequence, one from the middle of the CC cterminus of the fourth extracellular subdomain (EC-4) were CC cterminus of the fourth extracellular subdomain (EC-4) were CC designed for use as PCR primers. PCR was carried out on a rat brain CC cDNA preph. Two major bands of about 450 bps and 130 bps were found. CC cDNA preph. Two major bands of about 450 bps and 130 bps were found. CC conservations of the previously identified cadherin sequences. The 450 bp and 130 cc clones were isolated. The DNA and deduced AA sequences of the clones (including sequences corresp. to the PCR primers) are given CC clones (including sequences corresp. to the PCR primers) are given CC clones (including sequences corresp. to the PCR primers) are given CC catherins. The cadherins described thus far have highly conserved CC catherins. The cadherins described thus far have highly conserved CC catherins. The cadherins described thus far have highly conserved CC corresp. Sequences in the EC-3 including the consensus sequence CC v-re or D-Fe located at the middle region of the subdomain and CC corresp. Sequences of other subdomains, except for the Sth extraccellular subdomain (EC-5), are D-R-E and the sequences in R58801 cc little are subdomains include CC corresp. The contrast the deduced AA sequences of the new CC clones that corresp. to cadherin extracellular subdomains include CC corresp. The partial clones are homologous to contrast the deduced AA sequences of the new CC clones that corresp. to cadherin extracellular subdomains include CC correspectively. In contrast the deduced AA sequences of the new CC correspectively conserved to cadherin extracellular subdomains include CC correspectively conserved to conserve the partial clones are homologous to conserve the correspective the sequence of the conserve the correspective the partial clones are h
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

These protein sequences are involved in cell-cell adhesion. These sequences may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Suzuki

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PT Helicobacter pylori nucleic acid sequences and encoded PT Helicobacter pylori nucleic acid sequences and encoded PT polypeptide(s) - useful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection PS Claims 14,94; Page 677-678; 145pp; English.

CC This sequence is a H. pylori secreted protein.

CC This sequence is a H. pylori secreted protein.

CC Infection or to identify H. pylori polypeptide binding compounds, in the protein may be used in a vaccine to prevent or treat H. pylori compounds, in the protein as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC useful as potential H. pylori life cycle activators or inhibitors. The CC acid sequences complementary to the DNA act as antisense sequences and CC can be used to prevent the translation of H. pylori mrNA. Antibodies and acid sequences complementary to the DNA act as antisense sequences and CC and distribution of H. pylori-specific antisens. The genomic sequence of CC and distribution of H. pylori-specific antisens. The genomic sequence of CC use branically shearing the bacterial DNA. The sequences were analysed for the amino acid sequences predicted coding regions CC were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of conterest, particular regions can be isolated from H. pylori by PCR contents and proteins and polypeptide production, e.g. in E. coli posts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

PT Infection and for diagnosis of S. pylori infection
PT Infection and for diagnosis of H. pylori infection
PT Infection and for diagnosis of G. pylori infection
PT Infection and for diagnosis of H. pylori protein of unspecified function.
CC This sequence is a H. pylori protein to prevent or treat H. pylori
CC Infection or to identify H. pylori polypeptide binding compounds,
CC Useful as potential H. pylori life cycle activators or inhibitors. The
CC Useful as potential H. pylori life cycle activators or inhibitors. The
CC Useful as potential H. pylori if cycle activators or inhibitors. The
CC Useful as potential H. pylori if mylori infection. Nucleic
CC acid sequences complementary to the DNA act as antisense sequences and
CC can be used to prevent the translation of H. pylori mRNA. Antibodies
CC and distribution of H. pylori-specific antigens. The genomic sequence of
CC mylori (ATCC 55679) was determined from overlapping contigs generated
CC by mechanically shearing the bacterial DNA. The sequences were analysed
CC defined by computer evaluation. To identify likely H. pylori antigens for
CC vaccine development, the amino acid sequences predicted from various ORF
CC useful antigent for significant homology to other known or exported
CC interest, particular regions can be isolated from H. pylori by PCR
CC interest, particular regions can be isolated from H. pylori by PCR
CC interest, particular regions can be isolated from exported the sequences of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁

                                                                                                                                                                                                    Claim 5; Column 112; 59pp; English.

The present sequence is an antigenic epitope from human cadherin-5, which is a Ca2+ dependent cell adhesion protein. Antibodies or fragments that specifically bind the epitope can be used to purify the cadherin, determine its tissue expression and antagonise its ligand/antiligand binding activities.
                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-MAY-1997 (first entry)
Human cadherin-5 antigenic epitope (residues 242-252).

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Sat May 13 07:21:36 2000; MasPar time 4.30 Seconds 164.428 Million cell updates/sec

Description:
Perfect Score:
Sequence: Title: >US-08-991-628-5 (1-15) from US08991628.pep 113

Scoring table:

1 CECNIKVKDVNDNFP 15

PAM 150 Gap 15

Searched: 142080 segs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir62 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 25.922; Variance 35.935; scale 0.721

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RL J. Cell Biol. 126:507-518(1994).

CC --- FUNCTION: COMPONENT OF INTERCELLULAR DESMOSOME JUNCTIONS. INVOLVED

CC MEDIATING CELL-CELL ADDESION. MAY CONTRIBUTE TO EPIDERWAL CELL

CC ADDESIVENESS BETWEEN CELLS THAT EXPRESS DIFFERENTIAL

CC --- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

CC --- ALTERNATIVE PRODUCTS: FORMS 3A AND 3B ARE PRODUCED BY ALTERNATIVE

SPLICING OF THE SAME GENE.

--- TISSUE SPECIFICITY: STRATIFIED EPITHELIA ONLY (EPIDERWAIS, TONGUE,

ESOPHAGUS AND RUMEN).

1 DOMAIN: CALCIUM MAY BE BOUND BY THE CADHERIN-LIKE PEDERMTS.

I. FUNCTION: CADHERINS ARE CALCIUM DEPENDENT CELL ADHESION PROTEINS.

ITHEY PREFERENTIALLY INTERACT WITH THEMSELVES IN A HOMOPHILIC MANNER IN CONNECTING CELLS; CADHERINS MAY THUS CONTRIBUTE TO THE SORTING OF HETEROGENEOUS CELL TYPES. THIS CADHERIN MAY PLAY A IMPORTANT ROLE IN ENDOTHELIAL CELL BIOLOGY THROUGH CONTROL OF THE INTERCELLULAR JUNCTIONS. IT COHESION AND ORGANIZATION OF THE INTERCELLULAR JUNCTIONS IT CHESTON.
